Description

InteliGen[®] GPU - Ground Power Unit is comprehensive controller designed for land aircraft gen-sets operating at 400 Hz frequency. No additional external buttons, measure devices and indication lamps are needed for switchboard design.

InteliGen[®] GPU enables independent control of three circuit breakers. The first circuit breaker is supposed to supply external AC/DC converter for aircraft 28 VDC supply. The second and third circuit breaker is supposed to supply two AC feeders to aircraft.

Gen-set can be operated manually from controller front panel or remotely from external buttons or via modem or GSM modem.

Power cable connection to the aircraft is protected by plug feedback information with two different methods of plug feedback detection:

- plug feedback is required before GCB is closed,
- plug feedback is closed after voltage validation from aircraft.

Load bank TEST mode enables gen-set power test without connection to aircraft.

InteliGen[®] GPU supports DC line droop compensation, when DC line is used. Separate CT for DC line overcurrent can protect DC line overload.

InteliGen[®] GPU inputs/outputs configurability enables large customizing to different types of land aircraft applications.

InteliGen[®] GPU controller is equipped with powerful graphic display. Icons, symbols and bar graphs for intuitive operation.
